 $\#\# Import\ Data$

Cleaning: Tokenizing, Removing stopwords,tf-idf

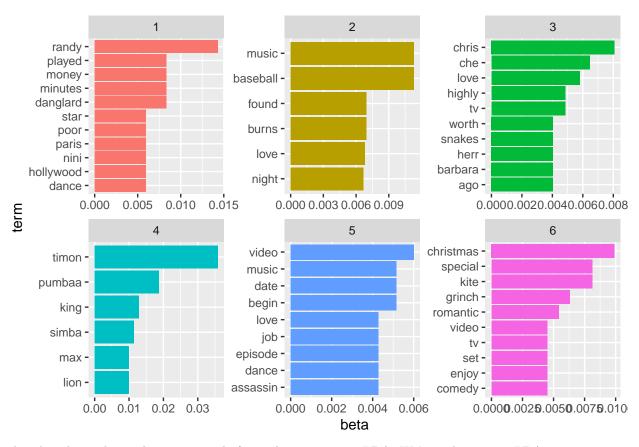

##The imdb dataset has a lot of stopwords and meaningless words. #We will remove stopwords and words unnessary for guessing movie genre.

```
library(stringr)
library(tidytext)
## tokenizing, count the number of words within each review.
token <- text_df %>%
    unnest_tokens(word, review) %>%
    count(review_index, word, sort=TRUE) %>%
    rename(count=n)

##There's a lot of stopwords. Let's remove them.

## create a stop word vector
stop <- unlist(stop_words[,1])
## drop the attribute
stop <- StripAttr(stop)
##restore tokens dataset to check their
check <- token
## check words agains stop word lists</pre>
```

```
remove <- check$word %in% stop</pre>
## to make it easier to see create a data frame
d <- cbind(token,remove)</pre>
## create an index of words(not stopwords)
f <- which(d$remove == FALSE)</pre>
##clean tokens that has no stopwords
clean_token <- d %>% slice(f) %>% select(-remove)
##Let's subset the data frame that has only meaningful words
##vector that has meaningless words
strings <- c("br", "movie", "film", "scene", "character", "story", "bit", "lot", "bad", "act", "hard", "awful", ",</pre>
##detect numbers of rows that has meaningless words
meaningless <- str_detect(clean_token$word, paste(strings, collapse = "|"))</pre>
##detect numbers of meaningful rows
has_meaning <- which(meaningless==F)</pre>
##subset: tokens without meaningless
clean_token <- clean_token %>% slice(has_meaning)
##remove redundant datas and values
rm(d,check,f,meaningless,has_meaning,strings,stop,remove,token)
#create lda model
library(topicmodels)
#convert sample token tibble to document term matrix for lda
clean_token_dmat <- clean_token %>%
  cast_dtm(review_index, word, count)
#select k=6 because 6 general film genres
imdb_lda <- LDA(clean_token_dmat, k = 6, control = list(seed = 1234))</pre>
imdb_topics <- tidy(imdb_lda, matrix = "beta")</pre>
library(ggplot2)
imdb_top_terms <- imdb_topics %>%
  group_by(topic) %>%
  slice_max(beta, n = 6) %>%
 ungroup() %>%
  arrange(topic, -beta)
imdb_top_terms %>%
  mutate(term = reorder_within(term, beta, topic)) %>%
  ggplot(aes(beta, term, fill = factor(topic))) +
  geom_col(show.legend = FALSE) +
  facet_wrap(~ topic, scales = "free") +
  scale_y_reordered()
```

The plot above shows the top 6 words for each topic in our LDA. We've split up our LDA into 6 genres, which represents the number of topics we have. The topic 4 looks like a famous Disney movie 'Lion King'.

```
#gamma: per-document-per-topic probabilities
imdb documents <- tidy(imdb lda, matrix = "gamma")</pre>

## # ... with 5,276 more rows
## # i Use 'print(n = ...)' to see more rows
```

The assignments tibble above count up the words for each topic.

##Let's look tf-idf to see what is the most important words in the whole reviews. ##tf-idf

```
review_tf_idf <- clean_token %>%
 bind_tf_idf(review_index, word, count)
##Look at terms with high tf-idf in reviews.
review_tf_idf<- review_tf_idf %>%
 arrange(desc(tf_idf))
##It looks like the high tf-idf's tf are mostly 1.
##For words that tf=1, it means those words are only contained on one review, and the tf-idf algorithm
##So, remove all tf != 1.
tf_1 <- which(review_tf_idf$tf==1)</pre>
tf_idf_high <- review_tf_idf %>% slice(tf_1) %% select(-count,-tf,-idf) #remove column 'count','tf','i
rm(review_tf_idf)
##review_index numbers in tf_idf_high
index <- unique(tf_idf_high$review_index)</pre>
##tf-idf plot
##Let's make the plots with only 6 review_index.
tf_idf_high %>%
 filter(review_index %in% c(25207,5044,5140,28289,25247)) %>%
 arrange(desc(tf_idf)) %>%
 group_by(review_index) %>%
```

Highest tf-idf words in whole reviews

IMDB Dataset

- On each 6 plot, we can see top 15 words with high tf-idf.
- Among them, we can verify some meaningful words for checking their genres.
- For example, in review'25247', the words 'censorship', 'erotic', 'sexuality' imply that the review is about romance movie.
